Salivary Hormone Tests

File Name: salivary_hormone_tests
Policy Number: OBGYN3093
Origination: 12/2004
Last Review: 12/2008
Next Review: 12/2010

Description of Procedure or Service

Many products of physiology and metabolism are known to be excreted by the body into the saliva. It has been proposed that measurement of these substances may be useful in some cases as an indicator of some disease states. For many substances the concentrations available in saliva do not correlate well with various disease states, are not as accurate as other testing methods, or have yet to be established as useful tools in the management or detection of disease. The tests are non-invasive and in some instances, may be obtained without a prescription. Most test kits are marketed to consumers as a tool for personal wellness and surveillance by pharmacies or labs, through the Internet or mail order services. [Salivary hormone](#) tests include but are not limited to Estrogens, Progesterone, Testosterone, [Cortisol](#), Melatonin and Dehydroepiandrosterone (DHEA).

Note: This policy does not apply to [salivary](#) estriol as a risk assessment for pre-term labor, which is listed separately in Medical Policy, OBGYN3092, [Salivary](#) Estriol as a Risk Predictor for Preterm Labor.

Policy

BCBSNC will provide coverage for Salivary Hormone Testing for Cortisol when it is determined to be medically necessary because the medical criteria and guidelines shown below are met.

BCBSNC will not provide coverage for Salivary Hormone Testing for evaluation of Estrogens, Progesterone, Testosterone, Melatonin or Dehydroepiandrosterone (DHEA) because the tests are considered investigational. BCBSNC does not cover investigational services.

Benefits Application

Please refer to Certificate for availability of benefits. This policy relates only to the services or supplies described herein. Benefits may vary according to benefit design, therefore certificate language should be reviewed before applying the terms of the policy.

Items that are purchased over-the-counter without a physician's prescription are benefit contract exclusion.

When Salivary Hormone Tests are covered

[Salivary Hormone](#) testing by radioimmunoassay for [cortisol](#) is considered medically necessary when performed to evaluate suspected [endogenous hypercortisolism](#) of Cushing's syndrome (CS) in children or adults. The testing should be ordered by a physician and performed in a CLIA (Clinical Laboratory

Policy: Salivary Hormone Tests

Improvement Amendments) approved laboratory.

When Salivary Hormone Tests are not covered

Salivary testing of **cortisol** is not covered for any indication other than as specified under "When Covered" above. **Salivary cortisol** testing for screening, diagnosing, or monitoring any other health condition, or any other indication, is considered investigational. BCBSNC does not cover investigational services.

Salivary Hormone testing of estrogen, progesterone, testosterone, melatonin, or dehydroepiandrosterone (DHEA) for the screening, diagnosis, or monitoring of **menopause** (pre, peri, and post), aging, **hormone** replacement therapy, or any other indication is considered investigational. BCBSNC does not cover investigational services.

Policy Guidelines

An assessment by the Institute for Clinical Systems Improvement (2008) concluded: "Currently, there is insufficient evidence in the published scientific literature to permit conclusions concerning the use of **salivary hormone** testing for the diagnosis, treatment or monitoring of **menopause** and aging."

The American College of Obstetricians and Gynecologists (ACOG), in their Committee Opinion #322, Compounded Bioidentical Hormones, address **salivary hormone** level testing as not meaningful because **salivary hormone** levels vary within each woman depending on her diet, the time of day, the specific **hormone** being tested, and other variables (ACOG 2005).

The North American Menopause Society (NAMS) in their position statement has concluded that "Salivary testing is not considered to be a reliable measure of testosterone levels."

A National Institutes of Health State-of-the-Science Conference Statement on Management of Menopause-related Symptoms (2005) reached the following conclusions about **salivary hormone** testing and bioidentical **hormones**: "Bioidentical **hormones**, often called "natural" **hormones**, are treatments with individually compounded recipes of a variety of steroids in various dosage forms, with the composition and dosages based on a person's **salivary hormone** concentration. These steroids may include estrone, estradiol, estriol, DHEA, progesterone, pregnenolone, and testosterone. There is a paucity of data on the benefits and adverse effects of these compounds."

Cushing's syndrome can be difficult to diagnose and is often a challenge for clinicians because other conditions share the same signs and symptoms. The laboratory investigations of CS are based on the demonstration of excessive **cortisol** secretion. **Cortisol** levels normally rise and fall throughout the day. In patients without CS, the levels drop significantly overnight. Several tests have been used extensively, but each of the currently available biochemical tests for the diagnosis of CS has limitations (24-hour urine free **cortisol** level and low dose dexamethasone suppression test). Late night **salivary cortisol** test is a simple way to screen for CS and it has been found to have high diagnostic sensitivity and specificity. Major advantages of this method are the reliability, non-invasiveness, and use in ambulatory patients.

The U.S. Food and Drug Administration (FDA) regulates laboratory tests under the Clinical Laboratory Improvement Act (CLIA). The CLIA stipulates that clinical laboratories need to be accredited by the College of American Pathologists Laboratory Accreditation Program.

Although saliva testing kits to evaluate **hormone** levels during **menopause** are currently available, these kits are not subject to FDA Approval. Several testing methods for salivary **cortisol** have been cleared for marketing by the FDA.

Policy: Salivary Hormone Tests

Billing/Coding/Physician Documentation Information

This policy may apply to the following codes. Inclusion of a code in this section does not guarantee that it will be reimbursed. For further information on reimbursement guidelines, please see Administrative Policies on the Blue Cross Blue Shield of North Carolina web site at www.bcbsnc.com. They are listed in the Category Search on the Medical Policy search page.

Applicable codes: S3650

BCBSNC may request medical records for determination of medical necessity. When medical records are requested, letters of support and/or explanation are often useful, but are not sufficient documentation unless all specific information needed to make a medical necessity determination is included.

Policy Key Words

Key Words: Hormones, Menopause, The change, OBGYN3093

Medical Term Definitions

Cortisol

the major natural glucocorticoid elaborated by the adrenal cortex; it affects the metabolism of glucose, protein, and fats and has mineralocorticoid activity.

Endogenous

developing or originating within the organism or arising from causes from within the organism.

Hormone

a chemical substance produced in the body by an organ, cells of an organ, or scattered cells, having a specific regulatory effect on the activity of an organ or organs.

Hypercortisolism

a genetic or acquired condition resulting in elevated levels of glucocorticoids, often as a result of tumors in adrenal or pituitary glands. Leads to significant weight gain, particularly on the back (causing a “buffalo hump”) and face. More commonly caused by steroid use/abuse, in which case it is called Cushing syndrome medicamentosus.

Menopause

cessation of menstruation in the human female, occurring usually around the age of 50.

Salivary

pertaining to the saliva.

Specialty Matched Consultant Advisory Panel - 12/2008

Policy Implementation/Update Information

From Original Policy Entitled: Salivary Hormone Tests for Menopause

12/23/2004 Specialty Matched Consultant Advisory Panel review -12/9/2004. Notification of new policy indicating that salivary hormone tests are not covered for the screening, diagnosing or monitoring of menopause. These tests are considered investigational and BCBSNC does not cover investigational services. Notification given 12/23/2004. Effective 3/3/2005.

Policy: Salivary Hormone Tests

1/17/07 Specialty Matched Consultant Advisory Panel review - 12/13/2006. No changes to criteria. Reference source added.

For Policy Entitled: Salivary Hormone Tests

1/12/09 Policy retitled to Salivary Hormone Tests. Policy sections updated to include guidelines for salivary hormone testing for indications other than menopause. Salivary Hormone testing by radioimmunoassay for cortisol is considered medically necessary when performed to evaluate suspected endogenous hypercortisolism of Cushing's syndrome (CS) in children or adults. The testing should be ordered by a physician and performed in a CLIA (Clinical Laboratory Improvement Amendments) approved laboratory. This is the only salivary hormone test that is covered. All other salivary hormone tests are considered investigational and are not covered for any indication. Reference sources added.

Medical policy is not an authorization, certification, explanation of benefits or a contract. Benefits and eligibility are determined before medical guidelines and payment guidelines are applied. Benefits are determined by the group contract and subscriber certificate that is in effect at the time services are rendered. This document is solely provided for informational purposes only and is based on research of current medical literature and review of common medical practices in the treatment and diagnosis of disease. Medical practices and knowledge are constantly changing and BCBSNC reserves the right to review and revise its medical policies periodically.
